Module Overview

Introduction

Welcome to Semester Project 2, designed to challenge candidates to work independently or collaboratively on a real-world assignment. The goal is to develop a front-end application for our online auction API, allowing users to register, list items for bidding, and engage in auctions seamlessly. Candidates must demonstrate their ability to plan, develop and document a dynamic, interactive solution for a specific target group. The back-end API will be provided and you or your team is responsible for implementing a high-quality front-end that integrates with it.

INFORMATION

There will be no lessons in this module. Your focus will be on the Semester Project.

Time commitment:

- **Full-time:** 5 weeks;
- **Part-time:** 10 weeks.

Learning Outcomes

This project aligns with the Semester Project 2 learning outcomes by requiring candidates to demonstrate their ability to independently or collaboratively develop a functional digital solution. Candidates should be able to:

In this module, we are covering the following **general knowledge** learning outcomes:

- The Candidate can assess his/her own work and the finished product in relation to the assignment description and guidelines for universal design in digital solutions.
- The Candidate has insight into his/her own opportunities for development in planning and designing digital solutions.

In this module, we are covering the following **skills** learning outcomes:

- The Candidate can explain his/her own vocational choices for tools, methods, and techniques for planning, developing, and designing digital solutions.
- The Candidate can explain his/her choice of relevant regulations and guidelines for universal design of digital solutions.
- The Candidate can reflect on his/her own creative and technical practices as a front-end developer and adjust them under supervision.
- The Candidate can find and refer to information related to project work and assess its relevance to the project.

In this module, we are covering the following **general competence** learning outcomes:

- The Candidate can plan and carry out the development of digital solutions alone and in accordance with ethical requirements and principles for universal design.
- The Candidate can carry out the individual development of digital solutions according to the needs of selected target groups.

SP2 - Semester Project 2

INFORMATION

Be sure to familiarise yourself with the Guidelines and Requirements, Submission Process and Grading Criteria sections (see the Table of Contents to the right). Please read the following instructions carefully. If any part is unclear or you have questions, contact the designated teachers through Microsoft Teams direct message. If you are struggling to understand the Semester Project instructions, contacting your teachers for help is perfectly acceptable. Please understand that the teachers cannot give students the answers or step-by-step instructions on how to implement the project requirements, as the Course Assignments, Projects and Exams are graded assessments. Teachers can, however, give clarification on Course Assignment instructions if needed.

Goal

To take the skills learnt over the last two years and take on an extensive project where the finished product should reflect the candidate's general development capabilities, in addition to visual and technical skills.

Project Learning Outcomes

- I can plan a web application project.
- I can design a UI for a web application.
- I can use HTML, CSS and vanilla JavaScript to build a web application interface.
- I can use vanilla JavaScript to interact with API data.
- I can use vanilla JavaScript to add UI functionality.
- I can write clean, modular code.
- I can test a web application using online tools.
- I can deploy a web application to a static host.

The brief

User Requirements

The application should allow users to register, log in and interact with listings. User authentication will be restricted to only those with an email address ending in @stud.noroff.no to ensure that only eligible participants can create an account. Once registered, users should be able to log in securely, manage their profiles and participate in the auction process.

Registered users will have the ability to edit and update their profile bio and set a custom avatar and banner. In the profile page, the registered user should be able to see listings they created and the listings they have made a bid on. Additionally, each user should be able to view their total credit, which represents their available funds for bidding on items. This information must be easily accessible within their account dashboard. The registered user's credits should always be visible on any page if the user is logged in.

One of the core functionalities of the application is the ability to create and manage (i.e update and delete) listings. A registered user should be able to create a listing by providing a title, a deadline date for the auction, a media gallery showcasing images of the item and a description. This ensures that potential bidders have all the necessary details to make informed decisions.

Bidding is an essential feature of the auction house. A registered user should be able to place bids on another user's listing. The system should display a history of bids made on each listing, allowing users to track the bidding process and adjust their bids accordingly. Transparency in the bidding process is crucial to fostering engagement and trust among users.

While participation in bidding requires registration, unregistered users should still be able to browse, search through available listings and view a single listing. This functionality ensures that prospective users can explore the platform's offerings before deciding to create an account. The search feature should be intuitive, allowing users to filter listings based on keywords, categories or other relevant attributes.

Design & User Experience Expectations

The interface should be modern, clean and responsive across all devices. Navigation should be intuitive, ensuring that users can seamlessly transition between browsing listings, placing bids and managing their profiles. Accessibility and ease of use are top priorities, as the platform will cater to a diverse audience. There should be a high-fidelity design in your design application for desktop and mobile screen sizes. The design must be interactive, which includes allowing a user to navigate through a happy flow in the application. The design must represent the final product complete with colors and web-optimised images.

INFORMATION

Repository

Only commits made to the Main branch of your created repository will be graded. Please ensure that **at least one commit** is made to your repository **before the weekend** of the submission deadline. **After the deadline**, you cannot commit any more code to your repository. Any attempts to commit after the deadline will be automatically rejected. See the Submission Process section for more info.

Guidelines and Requirements

Technical Requirements

You/your team will be responsible for implementing the front-end using modern web development practices. Integration with our provided API should be smooth, with clear error handling and feedback mechanisms to ensure a robust user experience.

API Documentation

- You are required to use version 2 (v2) of the Noroff API which can be found [here](#).
- The Auction House API can be found [here](#).
- Separate "Auth" end-points for authentication and authorization can be found [here](#).

Video Demonstration

Here is a demonstration video of the front-end application:

03:57

Technical Restrictions

There are technical restrictions in place.

No front-end frameworks such as Vue, React, Nuxt.js or Next.js are permitted in this assignment.

Hosting Services:

- GitHub Pages.
- Netlify.

- Vercel.

Design Applications:

- Figma

Planning Applications:

- Trello.
- GitHub Projects.

CSS Frameworks:

- Tailwind.
- Bootstrap.

Front-end Frameworks:

- You must use vanilla JavaScript/TypeScript.
- No frameworks, such as Vue, React, Nuxt.js or Next.js, are permitted.

API:

- You are restricted to using [v2 of the Noroff API](#).

Working in Groups

You may work in groups of up to 3 individuals per group. When working in a group, one student will need to create the repository, and then invite the other students to collaborate on the project.

Please note that the following applies when working in groups:

- A student may only work in one group and may not work across multiple groups.
- You will need to specify in your report who you have worked with, and each team member will still be required to write their own report.
- You must use branches, create pull-requests and follow a review process before the code is merged.

Submission Process

INFORMATION

Please upload the required links to your work as online text in Moodle for your submissions. The required links are as follows:

- Link to your Kanban board.
- Link to your Gannt chart.
- Link to your Figma style guide.
- Link to your Figma design.
- Link to your GitHub repository.
- Link to your deployed web application.

Submission Access

Please ensure that you test that each of your links are accessible prior to submission. Should a link not be accessible by the grader, no marks will be allocated. You can test if links are accessible by opening them in an Incognito tab.

Deliverables

- A link to the Figma design. Alternatively, you can submit a PDF document titled "Student Name - Figma design" which contains boards of all of the views in your design.
- A link to the Project Software you have used. Alternatively, you can submit a PDF document titled "Student Name - Project Management" which contains screenshots of the Sprints, Epics, and Issues, elaborating on why you chose to create these issues.
- A PDF Reflection report of the management of this project, explaining why some choices were made in developing this web application.
 - This section can discuss some of the more difficult tasks and how the results were achieved.
 - The reflection report section must be between 500-1000 words and can include additional screenshots of what is being addressed.
 - When working in a group, each team member must have their own report.
- A link to the GitHub repository.
- A link to the deployed front-end application.

Disclaimer - Appropriate Use of Course Assignments and Tools

By participating in this exam project and utilizing its tools, resources and assignments, you agree to abide by the following guidelines to ensure a respectful, ethical and legally compliant learning environment:

1. **Prohibited Content:** All submissions, posts and interactions must be free of the following:
 - Hate speech, including but not limited to racism, sexism and other discriminatory language.
 - References or promotions of illegal activities, such as drug use or trafficking.
 - Any content suggesting human trafficking, exploitation, pornography or any form of harm to individuals.

2. **Legal and Ethical Compliance:** Any use of course-provided platforms, including APIs, must adhere to applicable laws, ethical standards and the institution's code of conduct. Misuse of these resources for illegal, harmful or inappropriate purposes will not be tolerated.
3. **Consequences of Violations:** Submissions containing prohibited content will result in a warning and possible exclusion from the assignment. Incidents will be reviewed and may lead to disciplinary actions, which can include removal from the course and institution, notification of relevant authorities or other actions as deemed necessary.
4. **Responsibility:** Students are expected to exercise good judgment and professionalism in their work. The tools provided are meant for learning, development and innovation—misuse of these tools not only undermines personal growth but also disrupts the integrity of the program.

REMEMBER

Your work represents both yourself and the values of this institution. We encourage creativity, critical thinking and problem-solving, but these must be conducted within the boundaries of respect, ethics and legality.

For any questions or concerns regarding the appropriate use of course tools or assignments, please contact your instructor.

Acknowledgement

By continuing with this course assignment, you acknowledge that you have read and understood this disclaimer and agree to comply with its terms.

Commits or submissions **past the deadline** will not be considered for grading.

Late submissions will not be accepted, and there will be no exceptions to this rule.

Failure to submit this file to Moodle OR push (commit) your code to the repository will result in a **not passed** grade.

Grading Criteria

INFORMATION

You may contact your teacher for help if needed. However, please note that teachers **cannot give students answers or step-by-step instructions on how to implement the project requirements**, as this is a graded assessment. Teachers can, however, **give clarification on Course Assignment instructions** if needed.

The Semester Project 2 will be **graded "A to F"**. See more information on this below:

Grade	Meaning
F	0-39: Failed the course and have to do a Resit.
E	40-49
D	50-59
C	60-79
B	80-89
A	90-100

The following criteria will be used to assess student projects.

1. Functionality & Requirements Fulfilment:

- The project meets all specified user requirements (e.g., registration, login, listing creation, bidding, etc.).
- Core functionalities are implemented correctly and work without major issues.
- The integration with the back-end API is smooth and functions as intended.

2. User Experience & Design:

- The interface is visually appealing, consistent, and follows modern UI/UX principles.
- The platform is intuitive, with clear navigation and seamless user interactions.
- Accessibility best practices (universal design principles) are applied.

3. Code Quality & Best Practices:

- Code is well-structured, readable, and adheres to best practices.
- Proper use of modern development techniques and frameworks.
- Code is efficient and free of minor and major bugs.

4. Documentation & Process Explanation:

- A clear, well-structured report detailing the development process, design choices, and technical decisions.
- Explanation of how challenges were addressed and solutions implemented.

5. Project Management & Independence:

- The student demonstrates effective time management and planning.

6. Innovation & Creativity:

- The project includes unique features or enhancements beyond the minimum requirements.
- Creative solutions to improve the user experience or functionality are implemented.

Resources

Additional Video Content

Semester Project 2 - Walkthrough (pt1)

In this video we give you a walkthrough of the 1st part of the process, which is registering a user, logging in as a user and logging out. Here we will observe that when a user logs in their profile and an accessToken is stored in LocalStorage. This part of the program is one of the most important as you progress with the Course Assignment.

06:29

Semester Project 2 - Walkthrough (pt2)

This is a video showing part 2 of the process where a logged in user could proceed to which is updating their profile information. In this video we cover updating the logged in user's default avatar, banner and or bio to have more personalised information.

06:07

Semester Project 2 - Walkthrough (pt3)

This is a video showing here is a video showing part 3 of the process a logged in user could proceed to which may include: Creating a listing, updating a listing, deleting a listing, viewing a listing logged out.

06:32

00:57

Semester Project 2 - Walkthrough (pt4)

This is a video, part 4 showing the following: logged in user making their first bid and a couple more, bids placed being displayed in the listing, logged in user seeing a list of their bids in their profile page, logged in user cannot make a bid on their on listing, logged out user must login to make a bid on a listing.
